21.90µ SD 4.40µ CV 20.10% Curvature 28.80 deg/mm Staple Length 45 mm

(taken on 17th March 2023 at 9 Months of age)

Description:

Mullacott Pi is a pretty appaloosa alpaca. With a harlequin sire (caused by appaloosa gene) and appaloosa dam, Pi could be a rare 'double spot' genetics. She is very well head collar trained, always by using Camelidynamics methods. Mullacott Alpacas is a farm with high welfare and biosecurity standards. All alpacas are individually faecal tested every three months and only given appropriate treatment for any gut parasites if necessary. The whole herd is currently vaccinated with Bravoxin10, with six monthly boosters. A voluntary bTB test is carried out on every alpaca in the herd, annually. All deaths (over around 3 months of age) are subject of post mortem, to check for any undiagnosed health conditions.

We take bio-security very seriously, with all incoming alpacas thoroughly treated for any gut parasites, before moving onto the farm and then faecal tested on arrival and before leaving quarantine. Pre-movement tests are carried out for bTB and Johne's Disease (We have never had either disease diagnosed on the farm). All incoming alpacas are kept in quarantine for 4 weeks before joining the main herd.

We are willing to conduct any pre-movement tests/parasite treatments that you request.
